Agentic Engineering

Large-enterprise quality at costs that stay predictable

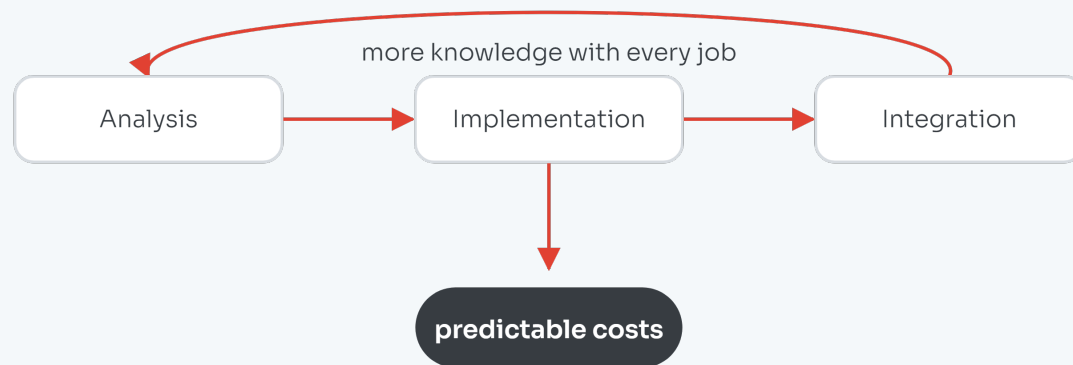

Agentic Software Engineering lowers the cost of your software development and gives you a level of quality that until now only large enterprises could afford.

Lower Costs, Raise Quality

Predictable from the start

It starts with an analysis of where you stand today. What needs to be built next comes from agentic implementation and becomes usable through a complete integration, at costs that stay predictable from the start. Every job adds to the knowledge and cost advantage that flows straight into your project.

Needs Analysis & Feasibility

Target and benefit are settled before you release a budget

It starts with a record of where you stand today: what runs, how it is used and where it reaches its limits. A small proof of concept on your real task gives a reliable cost estimate. Then comes the decision whether to extend an existing application or build it anew.

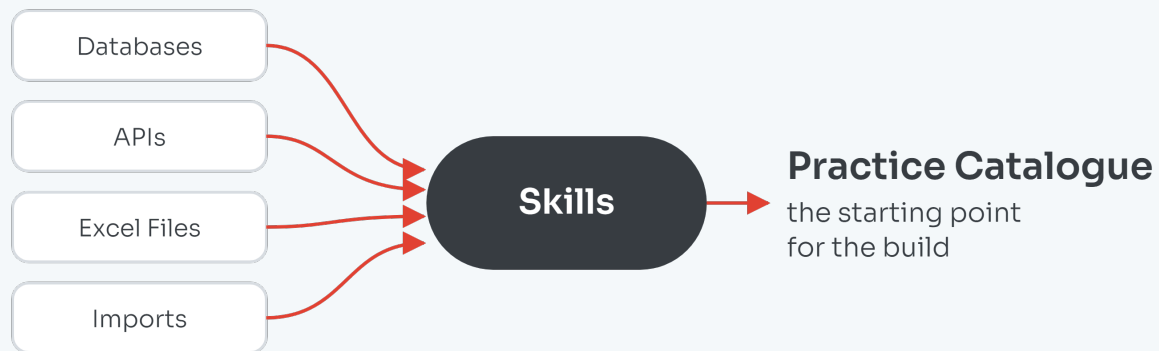

- 1 **Capture current state**
what runs today, where it hits limits
- 2 **Proof of Concept**
solid cost estimate
- 3 **Decision**
extend or rebuild

Building Domain Knowledge

Your processes, understood down to the database

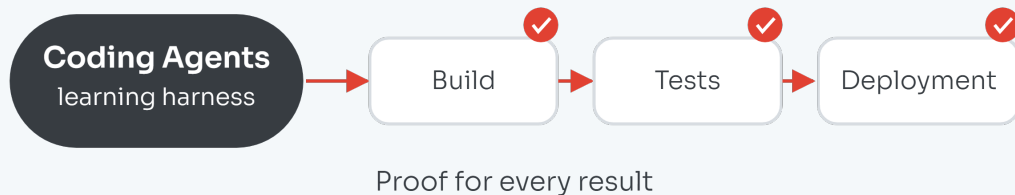

AI reads how each of your processes really runs today, down to databases, APIs, Excel files and scheduled imports, and checks it against the integration plan. The findings become skills, enriched with this practice's existing catalogue. That way implementation starts from knowledge of your business.

Agentic Implementation

Every result checked, every session learns

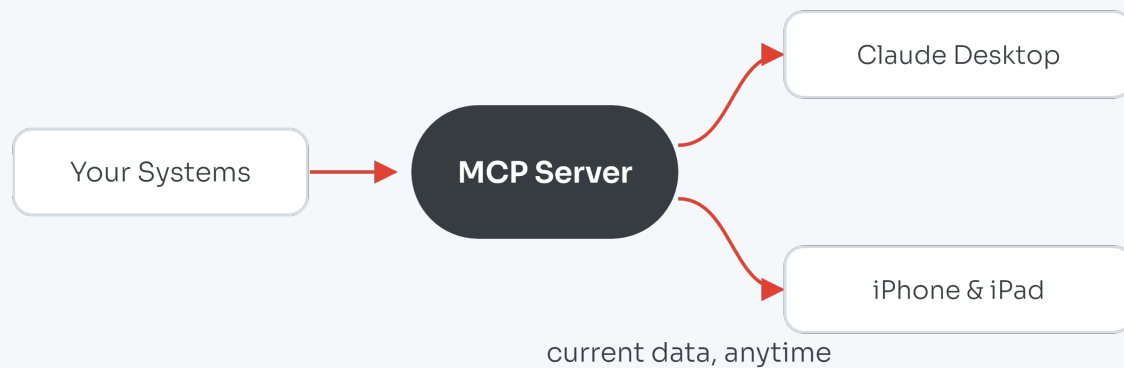

Coding agents carry out the implementation from a written plan, with a harness that learns from every session. Build, tests and deployment provide the evidence for every result. The implementation draws on a large set of existing skills, the domain knowledge this practice has gathered.

Complete Integration

Current data on every device

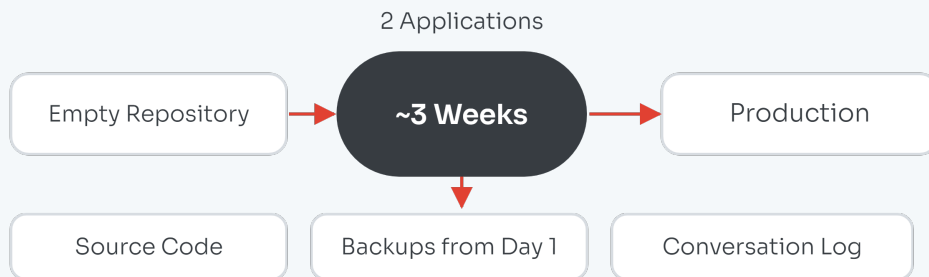

Custom MCP servers integrate your systems completely, so you can query and operate everything from one interface. Every answer comes straight from the running system, at your desk with Claude Desktop and on the road on iPhone and iPad. You work where and when it suits you.

Knowledge and Cost Advantage

Every job makes the next one cheaper

Every job leaves knowledge behind that benefits the next one: this is how two applications went from an empty repository to production in about three weeks each. Costs stay predictable, and you can switch hosting at any time. You get the source code of every application, backups from day one and a log of every conversation.

Knowledge Transfer at Every Level

Your team grows with it

Knowledge transfer covers every level: classic online training, training material on any topic and fully agentic training solutions, matched to what your team needs.
