Enterprise AI

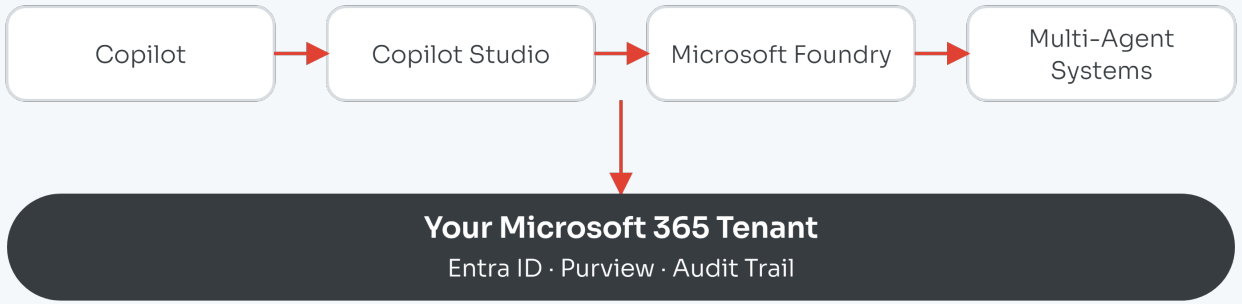
Agents in your own tenant, with provable governance

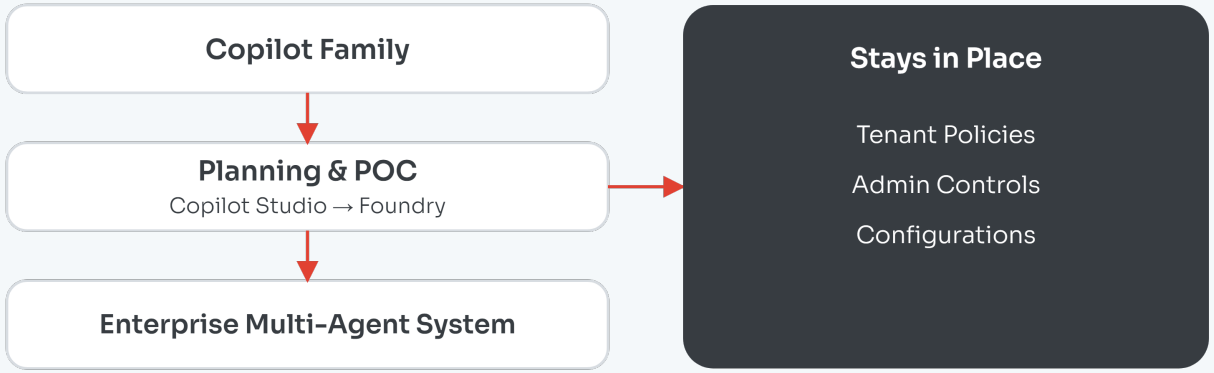
From Copilot and Copilot Studio through Microsoft Foundry to multi-agent systems on the Microsoft Agent Framework. Your agents run in your own Microsoft 365 tenant, with identity protection through Entra ID, compliance through Purview and a complete audit trail.



The Path to the Enterprise Agent

Tenant policies and admin controls stay in place

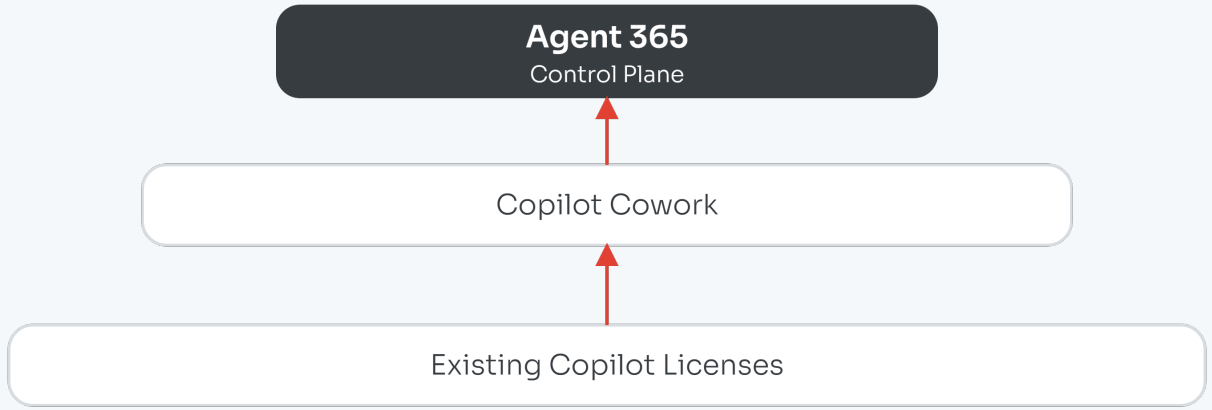
The path starts with the Microsoft Copilot Family your organization already uses. Planning and POC lead from Copilot Studio to Microsoft Foundry, and from there an enterprise multi-agent system takes shape on the Microsoft Agent Framework. Tenant policies, admin controls and existing configurations stay in place throughout.



Microsoft Copilot Family

The most valuable capabilities first

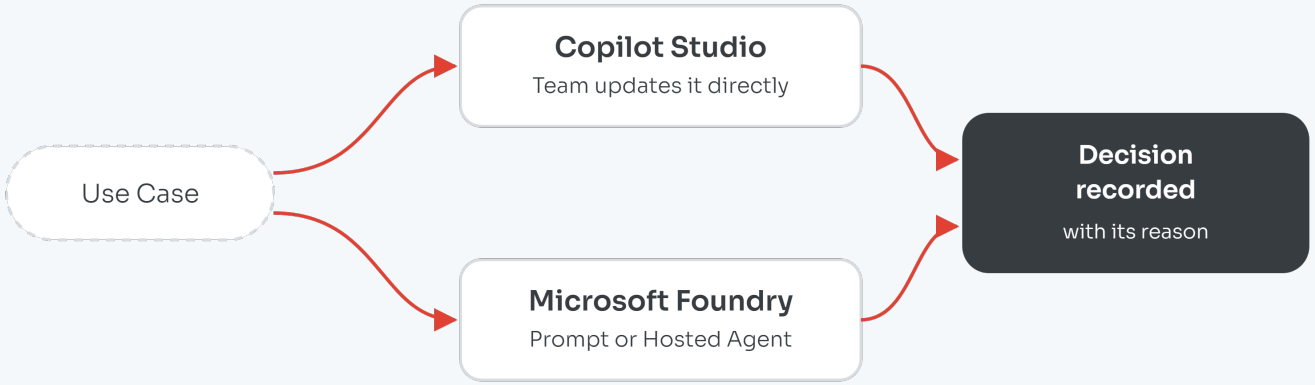
You start with your existing Microsoft Copilot licenses, anchored in your organization's data through Microsoft Graph. Which Copilot capabilities deliver the most value first is settled at the outset. From there the Copilot Family grows up to Copilot Cowork, and Agent 365 provides the control plane for agent inventory, permissions, behavior and activity across the whole tenant.



Planning and POC

Every platform decision justified in writing

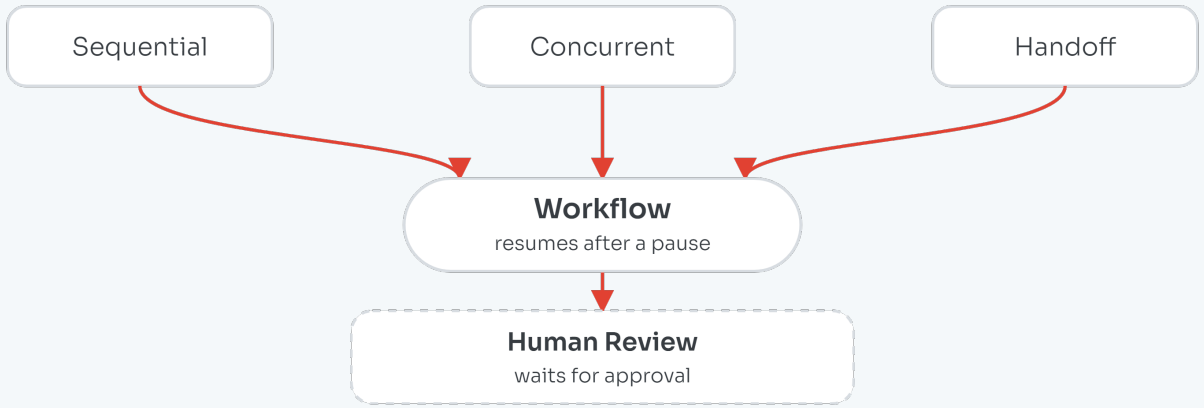
Planning and POC range from Copilot Studio to Microsoft Foundry, depending on which tier suits a use case best and how much governance it needs. Which Microsoft platform carries which workload is recorded with its reasoning, based on decisions made on running systems.



Enterprise Multi-Agent System

Enterprise-scale processes, coordinated by agents

On the Microsoft Agent Framework, several agents work together and cover large, branching business processes, from the first survey to a run someone can review. After a pause, a workflow continues exactly where it stopped, and steps that need approval wait for a person to review them.



Enterprise Compliance

Decided and documented

Use cases are classified against the risk tiers of the EU AI Act, and the transparency notices under Article 50 go into the user interfaces. Microsoft 365 Copilot, Copilot Studio and Microsoft Foundry each get their own governance path. The audit trail and the evidence for every agent are ready when an audit asks for them.

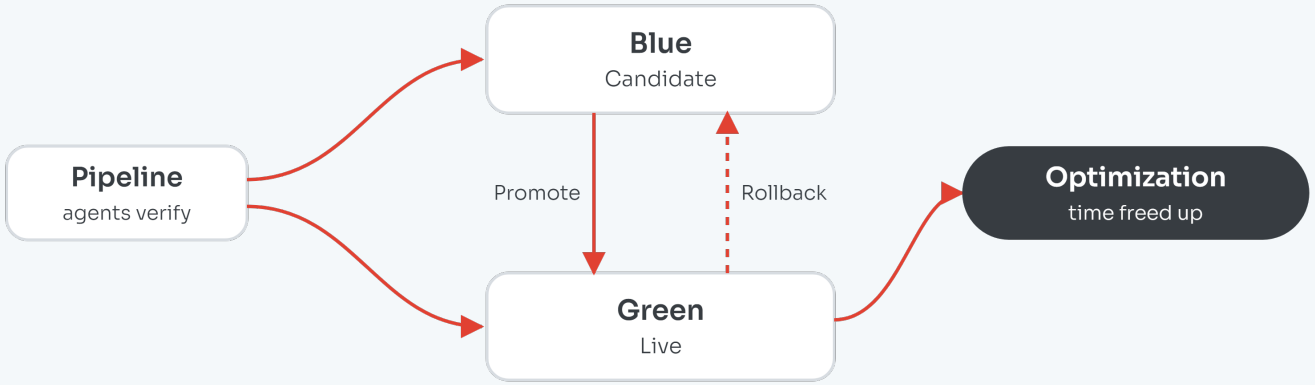
- Risk tier classified
- Article 50 notices included
- Audit trail ready

- Microsoft 365 Copilot
- Copilot Studio
- Microsoft Foundry

Agentic DevOps

Faster, more reliable releases for in-house engineering

Agents write and check the pipeline, and releases get faster and more reliable at once. Every app runs in two slots from the first deploy, and rollback is a single step. The time this frees up goes into deep optimization and new work.



Knowledge Transfer at Every Level

An enablement program for the team that takes over operations

Knowledge transfer covers every level: classic online training, training material on any topic and fully agentic training solutions, matched to what your teams need.
